Research Summary

A Gas Chromatography-Mass Spectrometer (GC-MS) is a powerful analytical instrument used to identify and quantify chemical compounds in a sample by combining two complementary techniques: gas chromatography (GC) and mass spectrometry (MS). In GC, a sample is vaporized and injected into a column where it is separated into its individual components based on their chemical properties, such as volatility and polarity. The separated compounds then enter the mass spectrometer, where they are ionized and fragmented. The resulting ions are analyzed based on their mass-to-charge ratios, providing a detailed chemical profile of the sample. GC-MS is widely used in fields such as environmental testing, forensics, food and beverage analysis, and pharmaceuticals for detecting trace amounts of substances, identifying unknown compounds, and confirming chemical purity.

The major global manufacturers of Gas Chromatography-Mass Spectrometer include Agilent Technologies, Shimadzu, Thermo Fisher Scientific, PerkinElmer, FPI, LECO,
