Research Summary

Gas-fired boilers are heating systems that utilize natural gas or propane as their primary fuel source for generating hot water or steam. In a gas-fired boiler, the fuel is burned in a combustion chamber, transferring heat to a heat exchanger. The heat exchanger then transfers this thermal energy to the water, producing either hot water for space heating or steam for various industrial processes. Gas-fired boilers are widely used in residential, commercial, and industrial settings due to their efficiency, reliability, and relatively cleaner combustion compared to some other fossil fuels. These boilers often feature advanced control systems for precise temperature regulation and energy efficiency. In addition to their space heating applications, gas-fired boilers play a crucial role in industries such as manufacturing, where steam is used for various processes like sterilization, heating, and power generation.

The major global manufacturers of Gas Fired Boilers include Viessmann, WOOD, Forbes Marshall, Babcock & Wilcox, Miura, Rentech Boiler, Fulton, Hurst Boiler & Welding Company, Hoval, Ferroli, Parker Boiler, Fondital, etc. The global players
