Research Summary

A Gasoline Direct Injection (GDI) system is an advanced fuel injection technology used in internal combustion engines, particularly in modern automotive engines. In a GDI system, fuel is directly injected into the combustion chamber of each cylinder at high pressure, as opposed to traditional port fuel injection systems where fuel is injected into the intake manifold. This precise fuel delivery allows for better control of the air-fuel mixture, resulting in improved combustion efficiency, increased power output, and reduced fuel consumption. GDI systems contribute to enhanced engine performance, responsiveness, and fuel economy by optimizing the combustion process. The system often employs high-pressure fuel pumps, injectors, and sophisticated engine management systems to achieve accurate fuel delivery based on various operating conditions. GDI technology has become widely adopted in the automotive industry as a means to meet stringent emission standards while improving overall engine efficiency.

The major global manufacturers of Gasoline Direct Injection (GDI) System include
