### Research Summary

Gasoline Particulate Filters (GPF) are emission control devices integrated into the exhaust systems of gasoline-powered vehicles to capture and reduce the release of particulate matter (PM) into the atmosphere. Similar to diesel particulate filters used in diesel engines, GPFs consist of a porous substrate that traps and collects fine particles produced during the combustion of gasoline. The collected particulate matter is periodically burned off or oxidized under high temperatures, a process known as regeneration. GPF technology has become increasingly important in meeting stringent emission standards, as particulate emissions from gasoline engines have gained attention due to their potential environmental and health impacts. By incorporating GPFs, automakers aim to enhance air quality and adhere to regulatory requirements, contributing to a cleaner and more sustainable automotive industry.

The major global manufacturers of Gasoline Particulate Filters (GPF) include Corning, NGK Insulators, Faurecia, Tenneco, Johnson Matthey, Umicore, Katcon, Bekaert, etc. The global players competition landscape in this report is divided into three tiers. The
