### Research Summary

A gear reducer, also known as a gearbox or speed reducer, is a mechanical device designed to decrease the rotational speed and increase the torque output of an input power source, usually a motor. This reduction in speed and increase in torque are achieved by interconnecting gears with different numbers of teeth. Gear reducers are employed in various industrial applications to match the speed and torque requirements of different machinery components. Often integrated into gear reducers, reduction motors combine an electric motor with a gear reduction system in a single compact unit. These reduction motors are widely used in machinery and equipment where the output speed and torque need to be adjusted to meet specific operational needs. The versatility of gear reducers and reduction motors makes them essential components in many mechanical systems, contributing to improved efficiency and performance across diverse industries.
