Research Summary

Geogrids are synthetic materials used in civil engineering and construction for soil reinforcement and stabilization applications. These grid-like structures are typically made from polymers such as polyethylene or polypropylene and exhibit high tensile strength. Geogrids are laid within soil or aggregate to enhance the load-bearing capacity of the ground, reduce soil erosion, and improve overall stability. They are commonly employed in the construction of retaining walls, slopes, embankments, and roads. Geogrids work by distributing forces and creating a reinforcing effect within the soil or fill material, preventing lateral movement and enhancing structural integrity. The use of geogrids can lead to more cost-effective and sustainable construction practices, particularly in projects where soil conditions require additional reinforcement to meet engineering requirements and ensure long-term stability.

The major global manufacturers of Geogrids include Feicheng Lianyi, Shandong New Slightly Geotechnical Material, Taian Modern Plastic, Maccaferri, Tensar, Shandong Hongxiang New Materials, Taian Road Engineering Materials, Nanchang Teamgo New Materials, Jiangsu Jiuding, NAUE Secugrid, GEO Fabrics, TechFab India, Tencate,
