Research Summary

Glass-ionomer cement is a dental restorative material commonly used in dentistry for various applications, including filling cavities, cementing dental crowns, and bonding orthodontic brackets. It is a dental cement composed of a powder, which typically contains fluoroaluminosilicate glass, and a liquid, which is an aqueous solution of an acid, such as polyacrylic acid. When mixed together, a reaction known as acid-base or glass-ionomer reaction occurs, leading to the hardening of the cement. Glass-ionomer cement exhibits properties such as adhesion to tooth structure, fluoride release, and biocompatibility. Its ability to chemically bond to tooth enamel and dentin makes it a valuable restorative material, and the fluoride release contributes to caries prevention. Glass-ionomer cement is widely used in both pediatric and adult dentistry due to its versatile applications and favorable clinical characteristics.
