Research Summary

Glass microfiber is a fine, lightweight material composed of extremely small glass fibers. These fibers are typically produced by melting glass and then drawing or blowing it into thin strands, resulting in fibers with diameters in the micrometer range. The unique characteristics of glass microfiber, such as high surface area, low thermal conductivity, and excellent chemical resistance, make it suitable for various applications. It is commonly used as a filtration media in air and liquid filtration systems, where its fine fibers efficiently capture particles and impurities. Glass microfiber is also employed in insulation materials, composites, and specialty papers. Due to its versatility and superior performance in demanding environments, glass microfiber plays a crucial role in industries such as aerospace, electronics, and laboratory applications where precise filtration and insulation properties are required.

The major global manufacturers of Glass Microfiber include Johns Manville, Unifrax, Hollingsworth and Vose, Lydall, Taishan Fiberglass (Sinoma), Ahlstrom, Zisun, Anhui Jiyao Glass Microfiber, Prat Dumas, OUTLOOK, Porex, etc. The global players
