### Research Summary

Glass wafers are thin, flat, and typically round discs made from glass that are used in various industries for electronic, optical, and sensor applications. These wafers serve as substrates for the fabrication of semiconductor devices, optical components, and microelectromechanical systems (MEMS). The glass wafers undergo precise manufacturing processes to achieve specific thickness, flatness, and surface quality. They may be composed of different types of glass, including borosilicate or soda-lime glass, depending on the application's requirements. Glass wafers find application in the production of integrated circuits, sensors, and optical devices due to their transparency, thermal stability, and compatibility with various manufacturing processes. The semiconductor and electronics industries rely on glass wafers for their role in enabling the miniaturization and functionality of a wide range of electronic and optical components.
