Research Summary

Glassy carbon coating on graphite involves applying a layer of glassy carbon, also known as vitreous carbon, onto a graphite substrate. Glassy carbon is a form of carbon that combines the desirable properties of glass and graphite, such as high thermal stability, low thermal expansion, excellent chemical resistance, and high electrical conductivity. This coating process enhances the surface properties of graphite, providing increased durability and resistance to chemical attack, oxidation, and wear. It is particularly useful in applications requiring high purity and performance under extreme conditions, such as in electrochemical electrodes, high-temperature crucibles, semiconductor manufacturing, and scientific research. The combination of graphite's structural properties with glassy carbon's surface characteristics results in a material that can perform reliably in harsh environments while maintaining its structural integrity and conductive properties.

The major global manufacturers of Glassy Carbon Coating Graphite include Toyo Tanso Co.,Ltd, IBIDEN Fine Graphite Material, Morgan Advanced Materials, Mersen, etc. The
