Research Summary

Glassy carbon is a non-graphitizing form of carbon known for its unique combination of properties, including high temperature stability, chemical inertness, low thermal expansion, and excellent electrical conductivity. Produced by the carbonization of organic precursors, such as phenolic resins or polyvinyl chloride, at high temperatures, glassy carbon is an isotropic material, meaning its properties are uniform in all directions. Its amorphous structure distinguishes it from graphite, providing it with exceptional mechanical strength and hardness. Glassy carbon is widely used in various applications, including as electrodes in electrochemistry, crucibles in high-temperature processes, and components in analytical instruments. Its versatility and stability make glassy carbon a preferred material in scientific, industrial, and research settings where high-performance carbon materials are required.

The major global manufacturers of Glassy Carbon include HTW Hochttemperatur-Werkstoffe, Tokai Carbon, Mersen, NEYCO, Alfa, SPI Supplies, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises
