Research Summary

A Glow Discharge Mass Spectrometer (GDMS) is an analytical instrument used for elemental analysis of solid samples. It employs a technique known as glow discharge spectroscopy, which involves the creation of a low-pressure, electrical discharge (glow discharge) within a gas-filled chamber. This discharge causes the sample surface to emit atoms, ions, and excited species. The mass spectrometer then separates and detects these species based on their mass-to-charge ratios, providing detailed information about the elemental composition of the sample. GDMS is particularly valuable in metallurgy, materials science, and semiconductor industries for its ability to analyze a wide range of elements with high sensitivity and precision. It is especially well-suited for trace element analysis in metallic samples, offering the capability to identify and quantify elements at low concentrations, making it an indispensable tool for quality control and research in various high-tech and industrial applications.

The major global manufacturers of Glow Discharge Mass Spectrometer (GDMS) include

Thermo Fisher, HORIBA, MSI, AMETEK, etc. The global players competition landscape in this report is divided into three tiers.
