Research Summary

Glutamine, often abbreviated as Gln, is an amino acid and a building block of proteins, making it one of the most abundant amino acids in the human body. It plays a crucial role in various physiological functions, serving as a primary fuel source for rapidly dividing cells, such as those in the immune system and the cells lining the digestive tract. Glutamine is considered a conditionally essential amino acid, meaning that while the body can synthesize it under normal circumstances, during certain conditions like illness, stress, or intense physical activity, the demand for glutamine may exceed the body's production capacity, necessitating dietary intake. In addition to its role in protein synthesis, glutamine is involved in maintaining acid-base balance, supporting immune function, and serving as a precursor for the synthesis of other important molecules in the body. It is found in a variety of foods, including protein-rich sources like meat, fish, dairy products, and certain plant-based foods. Glutamine supplements are sometimes used in specific medical conditions or situations where increased demand for this amino acid is anticipated.

The major global manufacturers of Glutamine (Gln) include Ajinomoto, Kyowa Hakko Kirin, Daesang, Meihua, Fufeng, etc. The global players competition landscape in this report is divided into three tiers.
