Research Summary

Glutathione is a tripeptide composed of three amino acids: cysteine, glutamic acid, and glycine. It is a vital antioxidant and plays a crucial role in cellular defense mechanisms. Found in nearly every cell of the body, glutathione acts as a powerful scavenger of free radicals, protecting cells from oxidative stress and damage. Beyond its antioxidant function, glutathione is involved in detoxification processes, aiding in the removal of harmful substances, including drugs and environmental toxins. Additionally, it supports the immune system, promotes the regeneration of other antioxidants, such as vitamins C and E, and participates in the maintenance of cellular redox balance. Glutathione is produced within the body, and its levels can be influenced by factors such as diet, stress, and environmental exposures. Given its importance in cellular health, glutathione has become a subject of interest in various medical and nutritional contexts, and there is ongoing research exploring its potential therapeutic applications.
