Research Summary

A GNSS (Global Navigation Satellite System) positioning correction service is a system designed to enhance the accuracy and reliability of location data provided by GNSS receivers such as GPS (Global Positioning System) or Galileo. These correction services use ground-based reference stations to monitor signals from GNSS satellites and calculate corrections for errors in satellite positions, atmospheric conditions, and other factors that can affect the accuracy of GNSS measurements. The corrections are then transmitted to GNSS receivers in real-time or as post-processing data, allowing them to improve their accuracy and provide more precise positioning information. GNSS positioning correction services are used in a wide range of applications, including precision agriculture, surveying, navigation, and autonomous vehicle guidance, where high-accuracy location data is essential.

The major global suppliers of GNSS Positioning Correction Service include Hexagon, Fugro, Trimble, Oceanering International, Beijing UniStrong, Topcon, u-blox,
