### Research Summary

Graphene Oxide (GO) is a derivative of graphene, consisting of a monolayer of carbon atoms arranged in a hexagonal lattice with oxygen-containing functional groups. It is produced through the oxidation and exfoliation of graphite, resulting in a material that retains the two-dimensional structure of graphene but with a significant increase in oxygen content. The presence of oxygen moieties, such as hydroxyl, epoxide, and carboxyl groups, imparts unique properties to graphene oxide, including improved dispersibility in water and enhanced chemical reactivity. Graphene oxide is a versatile material with applications in various fields, including nanotechnology, electronics, energy storage, and biomedical research. Its functional groups make it amenable to modification, allowing for tailored properties based on specific applications. Graphene oxide has been studied for its potential in drug delivery, sensors, and as a building block for the fabrication of advanced composite materials due to its tunable properties and compatibility with existing manufacturing processes.

The major global manufacturers of Graphene Oxide (GO) include Global Graphene Group, Graphenea, Abalonyx AS, Garmor, ACS Material, Cheap Tubes, BGT Materials
