Research Summary

Graphite granular and powder refer to finely divided forms of graphite, each serving distinct purposes in various industrial applications. Graphite powder consists of small particles of graphite, often used as a dry lubricant, a component in friction materials, or as a conductive additive in various materials such as polymers and composites. It also finds application in powder metallurgy for the production of graphite-based components. Graphite granules are larger particles than powder, and they are commonly utilized in applications like foundry coatings, lubricants, and as a raw material for the production of graphite molds and crucibles. Both graphite powder and granular forms leverage the excellent properties of graphite, including its lubricity, thermal conductivity, and chemical inertness, making them versatile materials in industries ranging from metallurgy to electronics. The choice between granular and powder forms depends on the specific requirements of the intended application.

The major global manufacturers of Graphite Granular and Powder include Haida Graphite, National de Grafite, Jinhui Graphite, Xincheng Graphite, Skaland Graphite,
