Research Summary

Grease interceptors, also known as grease traps or grease separators, are plumbing devices designed to capture and prevent the entry of fats, oils, and grease (FOG) from kitchen wastewater into the sewage system. These devices are commonly installed in commercial kitchens, restaurants, and food service establishments where significant amounts of grease are generated during food preparation and cooking. Grease interceptors work by slowing down the flow of wastewater, allowing the FOG to cool and solidify. As the wastewater passes through the interceptor, the grease and solids rise to the top, while the relatively cleaner water continues to flow out. Regular maintenance involves removing the accumulated grease and solids to prevent blockages in the plumbing and avoid the discharge of FOG into the municipal sewage system, which can contribute to sewer line clogs and environmental pollution. Grease interceptors play a crucial role in promoting proper wastewater management and environmental sustainability in food service industries.

The major global manufacturers of Grease Interceptors include Watts, Zurn, ZCL|Xerxes, Jensen Precast, Canplas, Rockford Separators, Josam, WADE, Jay R.
