### Research Summary

Grinding wheels are circular abrasive tools used in various machining and grinding processes to remove material from a workpiece, shape surfaces, or achieve precision finishes. These wheels are typically composed of abrasive particles bonded together with a matrix, which can be made from materials such as resin, rubber, or metal. The abrasive particles can be natural materials like corundum or synthetic materials like silicon carbide or diamond, depending on the intended application. Grinding wheels come in various shapes, sizes, and compositions, each designed for specific tasks ranging from rough material removal to fine surface finishing. They are crucial in metalworking, woodworking, and other industries where precise and efficient material removal is required, ensuring the production of components with accurate dimensions and smooth surfaces. Proper selection of grinding wheels based on the material being worked on and the desired finish is essential for achieving optimal results in machining processes.

The major global manufacturers of Grinding Wheels include Klingspor, 3M, Mirka
