### Research Summary

Halogenated butyl rubber refers to a type of synthetic rubber derived from butyl rubber through a halogenation process. Butyl rubber is a copolymer of isobutylene and a small amount of isoprene, known for its low permeability to gases and liquids, making it ideal for applications requiring good barrier properties. Halogenation involves introducing halogen atoms, such as chlorine or bromine, into the butyl rubber structure. This process modifies the polymer's properties, enhancing its resistance to heat, weathering, and chemicals. The resulting halogenated butyl rubber retains the excellent impermeability characteristics of butyl rubber while offering improved performance in terms of heat resistance and aging. This type of rubber is commonly used in the production of inner tubes, tire inner liners, seals, gaskets, and other applications where a combination of low gas permeability and resistance to harsh environmental conditions is essential.

The major global manufacturers of Halogenated Butyl Rubber include ExxonMobil, Lanxess, PJSC Nizhnekamskneftekhim, Japan Butyl, Sinopec Beijing Yanshan, Panjin

Heyun Group, Zhejiang Cenway, etc. The global players competition landscape in this report is divided into three tiers.
