Research Summary

Headless CMS (Content Management System) software is a type of content management solution that allows users to create, manage, and deliver digital content without a predefined front-end presentation layer. Unlike traditional CMS platforms, headless CMS separates the content creation and storage from the content presentation, giving developers the flexibility to use any technology or framework for building the user interface. In a headless CMS, content is stored in a backend database, and it can be delivered to various devices and platforms through APIs (Application Programming Interfaces). This approach enables a more modular and decoupled architecture, empowering organizations to deliver content seamlessly across websites, mobile apps, IoT devices, and other digital channels. Headless CMS is particularly advantageous for businesses that require flexibility, scalability, and the ability to adapt to evolving technologies and user experiences.
