Research Summary

Heat sinks are passive cooling devices used to dissipate and manage excess heat generated by electronic components, such as integrated circuits (ICs), transistors, and processors. Typically made of materials with high thermal conductivity, such as aluminum or copper, heat sinks absorb the heat from the electronic component and then transfer it to the surrounding air through fins or other cooling structures. The increased surface area allows for more efficient heat dissipation. Heat sinks play a crucial role in preventing overheating and maintaining the optimal operating temperature of electronic devices, thus ensuring their reliability and performance. In some cases, fans or other active cooling methods may complement heat sinks to enhance the cooling process. Heat sinks are commonly found in computers, power amplifiers, and other electronic systems where heat dissipation is critical for prolonged and stable operation.

The major global manufacturers of Heat Sinks include Alpha, Molex, TE Connectivity, Delta, Mecc.AI, Ohmite, Aavid Thermalloy, Sunon, Advanced Thermal Solutions, DAU, Apex Microtechnology, CUI, Radian, T-Global Technology, Wakefied-Vette, etc. The
