### Research Summary

Heat-treated flour is a type of flour that has undergone a process of heat treatment to reduce the risk of contamination by harmful pathogens such as E. coli and Salmonella. During heat treatment, the flour is subjected to high temperatures for a specified period, effectively killing any bacteria present while preserving the flour's functionality and nutritional properties. This process makes heat-treated flour safer for consumption, particularly in products like raw cookie dough or cake batter, where the flour may be eaten without further cooking. Heat-treated flour is increasingly used in commercial food production to minimize the risk of foodborne illnesses associated with raw flour consumption, providing consumers with a safer option for enjoying their favorite baked goods.
