Research Summary

Helical Submerged Arc Welding (HSAW) steel pipe is a type of longitudinally welded steel pipe produced through the helical welding process. In HSAW, a continuous helical strip of steel is formed and welded along its length, creating a pipe with a spiral seam. This welding technique, often used for large-diameter pipes, results in a strong and durable pipe suitable for various applications, including oil and gas transmission, water pipelines, and infrastructure projects. HSAW pipes are known for their high structural integrity and resistance to bending and deformation. The spiral weld provides uniform stress distribution, making these pipes well-suited for withstanding internal and external pressures. HSAW steel pipes are commonly used in the construction of pipelines for their efficiency in handling large volumes of fluids or gases and their adaptability to different terrains and environmental conditions.
