Research Summary

Hemodialysis is a medical procedure employed to perform the functions of the kidneys in individuals with impaired kidney function or kidney failure. It involves using a dialysis machine to filter and purify the blood, removing excess waste products, toxins, and fluid that the kidneys are unable to efficiently eliminate. During hemodialysis, blood is drawn from the patient through a vascular access point, typically a surgically created fistula or a catheter, and is then circulated through a dialyzer, a device that acts as an artificial kidney. Within the dialyzer, blood flows through thin tubes surrounded by a special dialysis solution, allowing the exchange of waste products and excess fluids. The purified blood is then returned to the patient's circulation. Hemodialysis is a critical life-sustaining treatment for individuals with end-stage renal disease, providing a means to manage electrolyte balance, blood pressure, and overall fluid levels in the absence of proper kidney function.

The major global manufacturers of Hemodialysis include Teleflex, BD, Baihe Medical, Merit Medical, Fresenius Medical Care, Medtronic, AngioDynamics, TuoRen, B. Braun,
