Research Summary

High carbon bearing steel refers to a type of steel that is specifically engineered for applications in the manufacturing of bearings, where high strength, hardness, and wear resistance are critical. The term "high carbon" indicates a higher percentage of carbon content in the steel alloy, typically above 0.60%. The increased carbon content contributes to enhanced hardness and strength, making the steel well-suited for withstanding the loads and friction encountered in bearing applications. The alloy may also contain other alloying elements such as chromium, manganese, and silicon to further improve properties like corrosion resistance and fatigue strength. High carbon bearing steel is widely used in the production of various types of bearings, including ball bearings and roller bearings, which are essential components in machinery and automotive systems, ensuring smooth operation and longevity under demanding conditions.

The major global manufacturers of High Carbon Bearing Steel include OVAKO, Sanyo Special Steel, CITIC Special Steel Group, DongbeiSpecialSteel, Juneng, etc. The global
