Research Summary

High-index lens monomer refers to the raw material used in the production of high-index plastic lenses. These monomers are typically made from various types of organic compounds, such as acrylics or polycarbonates. The term 'high-index' refers to the refractive index of the material, which determines how much light is bent or refracted as it passes through the lens. High-index lens monomers have a higher refractive index compared to standard lens materials, allowing them to bend light more efficiently. This property enables high-index lenses to be thinner and lighter than traditional lenses, especially for individuals with strong prescriptions. The monomer is polymerized and then processed into lenses using casting or injection molding techniques. High-index lenses provide superior optical performance while offering thinner and more aesthetically pleasing eyewear options.

The major global manufacturers of High Index Lens Monomer include Mitsui Chemicals, MGC, Miwon Commercial, Efirm New Material, etc. The global players competition landscape in this report is divided into three tiers. The first tier comprises global leading
