Research Summary

A High-Intensity Focused Ultrasound (HIFU) system is a medical technology that utilizes focused ultrasound waves to precisely target and treat specific tissues or tumors within the body. This non-invasive or minimally invasive therapeutic approach delivers concentrated acoustic energy to a focal point, generating intense heat and causing thermal ablation or coagulation of the targeted tissue. HIFU has various applications, including the treatment of certain cancers, particularly prostate cancer, uterine fibroids, and tumors in the liver and kidney. The system allows for real-time imaging guidance, ensuring accuracy and minimizing damage to surrounding healthy tissues. HIFU is recognized for its potential to provide an alternative to traditional surgery or radiation therapy with reduced side effects and shorter recovery times. As a result, it represents an innovative and promising technology in the field of medical interventions.

The major global manufacturers of High-intensity Focused Ultrasound System include Chongqing Haifu Medical Technology, Philips Healthcare, Changjiangyuan Technology
