Research Summary

A high purity copper target is a specialized material used in the production of thin films and coatings via physical vapor deposition (PVD) techniques such as sputtering. It is typically made from ultra-high purity copper with minimal impurities to ensure the quality and consistency of the deposited films. Copper targets are used in various industries, including semiconductor manufacturing, electronics, optics, and thin film solar cells. During the sputtering process, high-energy ions bombard the copper target, causing atoms to be ejected from the surface and deposited onto a substrate, forming a thin copper film. High purity copper targets are crucial for achieving desired film properties such as electrical conductivity, corrosion resistance, and adhesion strength. They are available in different shapes and sizes to accommodate various sputtering systems and deposition requirements, and their quality is carefully controlled to ensure uniformity and reproducibility in the deposited films.

The major global manufacturers of High Purity Copper Target include JX Metals, Honeywell, Konfoong Materials, Tosoh, ULVAC, Grikin Advanced MATERIALS,
