Research Summary

High purity pseudo boehmite is a form of aluminum oxide hydroxide (AlOOH) with high levels of purity and well-defined physical properties. It is characterized by its high surface area, controlled pore structure, and excellent dispersibility, making it suitable for various advanced applications. This material is commonly used as a precursor in the production of high-performance catalysts and catalyst supports, due to its ability to transform into gamma-alumina upon calcination. Additionally, high purity pseudo boehmite is utilized in the manufacturing of ceramics, coatings, and as a binder in the production of zeolites. Its purity and specific physical attributes ensure optimal performance in processes where contamination or impurities could significantly affect the end product's quality and efficiency.

The major global manufacturers of High Purity Pseudo Boehmite include Sasol, Basf, Zibo Xiangrun Environment Engineering, Rina Chemicals, Zibo Honghe Chemical, CHINALCO, etc. The global players competition landscape in this report is divided into three tiers.
