Research Summary

High Tibial Osteotomy (HTO) Plates are orthopedic implants used in a surgical procedure known as high tibial osteotomy. This surgical technique involves the intentional alteration of the alignment of the tibia (shinbone) to relieve pressure on damaged or arthritic areas of the knee joint. HTO plates are specifically designed implants made from materials such as titanium or stainless steel, and they are used to stabilize the repositioned bone during the healing process. These plates provide structural support and fixation, allowing the bone to heal in its corrected position. High Tibial Osteotomy is often performed to address certain types of knee arthritis or correct malalignment issues, aiming to alleviate pain, improve joint function, and potentially delay the need for knee replacement surgery. The HTO plates are essential in maintaining the stability and proper alignment of the tibia during the critical phases of bone healing following the osteotomy.
