### Research Summary

High titanium slag refers to a type of slag produced during the smelting or refining of titanium-containing ores, typically ilmenite ( $\text{FeTiO}_3$ ) or rutile ( $\text{TiO}_2$ ), in metallurgical processes such as the Kroll process or the Becher process. Titanium slag is a byproduct of titanium production and contains a high percentage of titanium dioxide ( $\text{TiO}_2$ ), along with other metallic oxides such as iron oxide ( $\text{FeO}$ ), aluminum oxide ( $\text{Al}_2\text{O}_3$ ), and silicon oxide ( $\text{SiO}_2$ ). The term "high titanium slag" typically denotes slag with a high titanium content, often exceeding 70-80%  $\text{TiO}_2$ . This type of slag is further processed to extract pure titanium dioxide through methods such as acid leaching, hydrometallurgical processes, or reduction processes. High titanium slag is a valuable raw material for the production of titanium dioxide pigment, titanium sponge for metal production, titanium alloys, and various other titanium-based products used in aerospace, automotive, medical, and industrial applications. The utilization of high titanium slag contributes to the efficient recovery of valuable titanium resources and supports the growing demand for titanium materials in advanced industries.
