Research Summary

Hindered amine light stabilizers (HALS) are a class of chemical compounds widely used in the polymer industry as additives to protect materials from the degrading effects of light exposure. These stabilizers contain hindered amines, which are nitrogen-containing compounds with steric hindrance that prevents them from reacting with other molecules. When incorporated into polymers such as plastics, coatings, and elastomers, HALS act as light stabilizers by scavenging free radicals generated during the degradation process caused by exposure to ultraviolet (UV) radiation. By preventing the formation of harmful chemical reactions, HALS contribute to the preservation of the polymer's physical and mechanical properties, including color, flexibility, and strength. Hindered amine light stabilizers are extensively used in outdoor applications, such as automotive components, building materials, and outdoor furniture, where protection against UV-induced degradation is crucial for extending the lifespan and maintaining the appearance of the polymer-based products.

The major global manufacturers of Hindered Amine Light Stabilizers (HALS) include BASF, Sabo SpA, Suqian Unitech, Solvay, Zhenxing Fine Chemical, Beijing Tiangang Auxiliary, Rianlon, Nangong Shenghua Chemicals, Addivant, Clariant, ADEKA, Tangshan Longquan Chemical, Jiangsu FOPIA Chemicals, Disheng Technology, Sunshow Specialty Chemical, Everlight Chemical, 3V Sigma, etc. The global players competition landscape in this report is divided into three tiers.
