Research Summary

Hip implants are medical devices used in orthopedic surgery to replace a damaged or diseased hip joint with artificial components. These implants are designed to replicate the function of the natural hip joint, which consists of a ball (femoral head) and socket (acetabulum). The prosthetic hip components are typically made of durable materials such as metal, ceramic, or a combination of both, and they may be fixed into the bone with or without cement. Hip implants are commonly used in procedures like total hip arthroplasty (THA) to address conditions such as osteoarthritis, rheumatoid arthritis, or fractures that compromise the hip joint. The goal of hip implant surgery is to relieve pain, improve joint function, and enhance the patient's overall quality of life. Advances in materials and implant design have contributed to the success of hip implant procedures, allowing many individuals to regain mobility and enjoy an improved range of motion following surgery.

The major global manufacturers of Hip Implants include Zimmer Biomet Holdings, Stryker Corporation, Medtronic, Smith and Nephew, Integrum, ConMed, Southern Implants, Straumann, DePuy Synthes, Danaher, etc. The global players competition
