Research Summary

Heterojunction with Intrinsic Thin layer (HIT) solar cells, also known as HJT solar cells, are a type of high-efficiency photovoltaic device that combines thin layers of amorphous silicon (a-Si) with crystalline silicon (c-Si) to generate electricity from sunlight. These solar cells utilize a heterojunction design, where a thin layer of intrinsic amorphous silicon is sandwiched between layers of doped crystalline silicon, forming a p-n junction. The heterojunction structure reduces recombination losses and improves charge carrier collection efficiency, resulting in higher conversion efficiencies compared to conventional crystalline silicon solar cells. HIT solar cells offer advantages such as higher power output, improved performance in low light conditions, and reduced temperature sensitivity, making them suitable for both residential and commercial solar panel installations where maximizing energy production and space efficiency are priorities.

The major global manufacturers of HIT (HJT) Solar Cell include Panasonic, Sanyo, EAS Batteries GmbH, Suzhou Maxwell, Tongwei Co.Ltd, Risen Energy, China Petroleum
