Research Summary

Hollow fiber filtration is a separation process used in various industries for the purification and filtration of liquids. This method employs a network of small, hollow fiber tubes, typically made of materials like polymeric membranes or ceramic, to filter out impurities from a fluid stream. In hollow fiber filtration, the fluid is directed through the lumens of the fibers, while contaminants are either trapped within the fibers or rejected from the system. This technology is widely utilized in water treatment processes, such as ultrafiltration and microfiltration, to remove particles, bacteria, and other contaminants. Additionally, hollow fiber filtration is employed in medical applications, including hemodialysis, where it serves as a critical component for blood purification. The high surface area and efficiency of hollow fiber filtration make it a versatile and effective method for various applications requiring precise separation and purification of liquids.

The major global manufacturers of Hollow Fiber Filtration include SUEZ, DuPont, Asahi Kasei, CITIC Envirotech, Mitsubishi Chemical, Koch Industries, Sumitomo Electric
