Research Summary

Hollow glass microspheres, also known as glass bubbles, are microscopic spherical particles with a thin-walled, hollow interior. Composed primarily of glass, these microspheres have a wide range of applications in various industries. Their low density and high strength make them valuable as lightweight fillers in materials such as plastics, composites, and coatings, contributing to enhanced strength-to-weight ratios and thermal insulation properties. Additionally, hollow glass microspheres are utilized in industries like oil and gas for drilling fluids, where their buoyancy helps control density. In the field of construction, these microspheres can be incorporated into cementitious materials to reduce weight and improve insulation. The versatile properties of hollow glass microspheres make them valuable in creating materials with tailored characteristics for specific applications across engineering, manufacturing, and scientific research.

The major global manufacturers of Hollow Glass Microspheres include 3M, Potters Industries, Sinosteel Corporation, Trelleborg, Zhongke Huaxing New material,
