Research Summary

A hologram is a three-dimensional (3D) image created through the recording and reconstruction of light waves. It is produced using laser beams to capture the interference pattern between light scattered from an object and a reference beam. Unlike traditional photographs, which capture only a two-dimensional representation, holograms recreate the depth and perspective of the original scene, allowing viewers to perceive the image in three dimensions. When illuminated with coherent light, such as laser light, the holographic image appears to float in space, exhibiting parallax and providing a sense of depth and realism. Holograms have a wide range of applications, including security features on credit cards and banknotes, artistic expression, scientific visualization, and immersive displays in virtual reality. The intricate and realistic nature of holography makes it a fascinating technology with diverse uses in various fields.

The major global suppliers of Hologram include Lyncee Tec, zSpace, Inc, HoloTech Switzerland AG, Vision Optics GmbH, Eon Reality, Inc, Holoxica Limited, 4Deep inwater imaging, Geola, Leia, Inc, Ovizio Imaging Systems NV/SA, RealView Imaging, Phase
