### Research Summary

A holographic grating is a specialized optical device that uses holography to produce a periodic structure of diffractive elements. The grating is created by recording the interference pattern between a reference beam and a diffracted beam from an object or pattern, resulting in a three-dimensional representation of the diffractive elements. The holographic grating functions as a diffraction grating, dispersing light into its component wavelengths based on the spacing of the recorded elements. This dispersed light pattern can be used for various applications, including spectroscopy, where it separates and analyzes different wavelengths of light. Holographic gratings are valued for their ability to provide precise control over the dispersion of light, making them essential in scientific and analytical instruments to study the spectral characteristics of materials.

The major global manufacturers of Holographic Grating include HORIBA, Newport Corporation, Edmund Optics, Shimadzu Corporation, Zeiss, Dynasil Corporation, Kaiser Optical Systems, Spectrogon AB, Headwall Photonics, Thorlabs, Photop Technologies, Wasatch Photonics, Spectrum Scientific, GratingWorks, Shenyang Yibeite Optics, etc.
