Research Summary

Holter monitoring is a diagnostic procedure in cardiology that involves the use of a portable device known as a Holter monitor to continuously record and monitor a patient's heart activity over an extended period, typically 24 to 48 hours or longer. The Holter monitor consists of a small recording device connected to electrodes placed on the patient's chest. These electrodes continuously capture the electrical signals generated by the heart, allowing the monitor to record data on heart rate, rhythm, and any irregularities or abnormalities during the entire monitoring period. Holter monitoring is commonly employed to investigate symptoms such as palpitations, dizziness, or unexplained chest pain.
