Research Summary

Horizontal Low-Pressure Chemical Vapor Deposition (LPCVD) refers to a manufacturing process used in semiconductor fabrication and other industries to deposit thin films of material onto a substrate. In the horizontal LPCVD configuration, the substrate is placed horizontally within the process chamber, and the deposition occurs through the introduction of precursor gases that react on the substrate surface, forming a thin film. The LPCVD technique is often used to deposit materials like silicon nitride, polysilicon, and silicon dioxide, which are integral in the production of semiconductor devices. The horizontal LPCVD configuration allows for uniform and controlled deposition across the substrate, facilitating the precise creation of thin films with desired properties for electronic components and microelectromechanical systems (MEMS). This method is a key element in the fabrication processes of integrated circuits and other advanced electronic devices.

The major global manufacturers of Horizontal LPCVD include SVCS, Centrotherm, Tystar, NAURA, MKS Instruments, Laplace Energy Technology, Qingdao Yuhao,

Thermco Systems, etc. The global players competition landscape in this report is divided into three tiers.
