Research Summary

Hospital-acquired pneumonia (HAP) prevention involves a set of strategies aimed at reducing the risk of pneumonia in patients who develop infections during hospitalization, typically 48 hours or more after admission. Since HAP is often caused by bacterial pathogens and is a leading cause of hospital-associated infections, prevention measures focus on maintaining proper hygiene, reducing ventilator-associated risks, and strengthening patient immunity. Key preventive practices include hand hygiene, oral care with antiseptics, elevating the head of ventilated patients to reduce aspiration risk, timely removal of invasive devices, and administering appropriate prophylactic antibiotics when necessary. Additionally, improving patient mobility and encouraging deep breathing exercises help prevent lung infections. Effective HAP prevention not only reduces patient morbidity and mortality but also decreases hospital stays and healthcare costs.
