Research Summary

A hubless dicing blade is a specialized cutting tool used in semiconductor manufacturing and other precision industries for the process of dicing or cutting wafers into individual chips. Unlike traditional dicing blades that have a central hub, hubless dicing blades are designed without a hub, allowing for a larger cutting area and reduced contact with the workpiece. This design minimizes blade-induced chipping and improves the overall precision of the dicing process. Hubless dicing blades are commonly used in applications where precise and clean cuts are crucial, such as the production of integrated circuits and microelectromechanical systems (MEMS). The absence of a hub reduces the chances of blade runout, enhancing the blade's stability and cutting accuracy during the dicing operation, leading to improved yield and quality in semiconductor manufacturing processes.

The major global manufacturers of Hubless Dicing Blade include DISCO, Kulicke & Soffa, ADT, Asahi Diamond Industrial, UKAM, Ceiba, etc. The global players competition landscape in this report is divided into three tiers.
