### Research Summary

A hydroponic system is a method of growing plants without soil, where nutrient-rich water is used as a medium to deliver essential nutrients directly to the plant roots. In hydroponics, plants are typically grown in inert substrates like perlite, coconut coir, or nutrient-rich water solutions, allowing for precise control over the growing conditions. The roots of the plants have direct access to the nutrients they need, and this method often results in faster growth and increased yields compared to traditional soil-based cultivation. Hydroponic systems can vary widely, ranging from simple setups like nutrient film technique (NFT) and deep water culture (DWC) to more complex systems such as aeroponics and vertical farming. This method is popular in agriculture and horticulture for its efficiency in resource utilization, water conservation, and the ability to grow crops in environments where traditional soil-based farming may be challenging.

The major global suppliers of Hydroponic System include Backyard Aquaponics, AMCO, Sun Circle, General Hydroponics, etc. The global players competition landscape in this report is divided into three tiers.
