Research Summary

Hydroxyapatite ceramics are a type of bioceramic material composed of calcium phosphate compounds, specifically hydroxyapatite (HA), which is a natural mineral component of bone and teeth. In the context of ceramics, hydroxyapatite is often synthetically produced and used for various biomedical applications. Hydroxyapatite ceramics possess excellent biocompatibility and bioactivity, making them suitable for bone grafts, coatings on orthopedic implants, and other medical devices. Their chemical composition closely resembles the mineral phase of natural bone, facilitating integration with the surrounding biological tissues. Hydroxyapatite ceramics are known for their osteoconductive properties, promoting bone growth and regeneration. Additionally, they can be engineered to have specific porosity and mechanical strength to match the requirements of different applications in orthopedics and dentistry. The use of hydroxyapatite ceramics in the medical field contributes to advancements in bone repair and replacement technologies.

The major global manufacturers of Hydroxyapatite Ceramics include SofSera,
