### Research Summary

A hyperspectral camera is an imaging device that captures a broad spectrum of wavelengths across the electromagnetic spectrum, often covering both visible and non-visible regions, such as near-infrared and short-wave infrared. Unlike traditional cameras that capture images in just three color channels (red, green, and blue), a hyperspectral camera records hundreds or even thousands of narrow, contiguous spectral bands, enabling the detailed analysis of the chemical and physical properties of objects. Each pixel in the image contains a spectral signature, which can be used to identify materials, detect subtle changes in composition, and analyze environmental conditions. Hyperspectral cameras are widely used in fields such as remote sensing, environmental monitoring, agriculture, mineral exploration, and medical imaging. They offer powerful capabilities for tasks like identifying plant diseases, mapping land cover, or detecting pollutants, making them an essential tool for advanced scientific research and industrial applications.

The major global manufacturers of Hyperspectral Camera include Specim, Headwall

Photonics, IMEC, Norsk Elektro Optikk A/S, Cubert, Corning (NovaSol), Telops, Zolix (Dualix), Surface Optics, Wayho Technology, Resonon, ITRES, Brimrose, BaySpec, Spectra vista, TruTag, etc. The global players competition landscape in this report is divided into three tiers.
