Research Summary

A hyperthermia device is a medical apparatus designed to elevate and maintain the temperature of a targeted area of the body or the entire body itself for therapeutic purposes. Hyperthermia, or the intentional increase in body temperature, can be applied locally or systemically to enhance the effectiveness of certain medical treatments. In oncology, for example, hyperthermia devices may be used to heat tumors, making them more susceptible to radiation therapy or chemotherapy. Hyperthermia can also stimulate the immune system and improve blood circulation. These devices can take various forms, such as external applicators, intracavitary probes, or whole-body hyperthermia systems. The controlled application of elevated temperatures is carefully monitored to achieve therapeutic benefits while minimizing potential side effects. Hyperthermia is an evolving area of medical research, with ongoing exploration of its potential applications in treating various medical conditions beyond cancer.

The major global manufacturers of Hyperthermia Device include Pyrexar Medical, Celsius42, Oncotherm, Andromedic, Vinita, Perseon, Nanjing Greathope, Shanghai
