Research Summary

An ignition coil is a crucial component in the ignition system of internal combustion engines. It transforms low-voltage electrical power from the battery into high-voltage power needed to create a spark at the spark plugs. The ignition coil consists of primary and secondary winding circuits, typically wrapped around an iron core. When the engine's ignition system is activated, current flows through the primary winding, generating a magnetic field. When the current is interrupted, the magnetic field collapses, inducing a high voltage in the secondary winding. This high voltage is then sent to the spark plugs, where it creates a spark to ignite the air-fuel mixture in the engine's cylinders. Ignition coils play a key role in ensuring reliable engine performance and combustion, and they are commonly found in both traditional distributor-based ignition systems and modern distributorless ignition systems.

The major global manufacturers of Ignition Coil include Bosch, Denso, Delphi, Tenneco (Federal-Mogul), BorgWarner, AcDelco, Hitachi, NGK, Eldor Corporation, Yura, Mitsubishi, SMP, SparkTronic, Marshall Electric, SOGREAT, Diamond Electric Mfg, Jiaercheng, KING-AUTO, etc. The global players competition landscape in this report is
