Research Summary

Image-based FFR (Fractional Flow Reserve) diagnosis is a non-invasive technique used to assess the severity of coronary artery disease (CAD) by measuring blood flow in the coronary arteries using medical imaging technologies. FFR is a physiological index that helps determine whether a coronary artery stenosis (narrowing) is causing significant restriction of blood flow, potentially leading to ischemia or reduced oxygen supply to the heart muscle. In image-based FFR, coronary angiography images are combined with computational fluid dynamics (CFD) or other advanced algorithms to simulate blood flow and calculate FFR without the need for invasive pressure wire measurements. This method allows physicians to evaluate coronary lesions with high accuracy and guide treatment decisions, such as determining whether angioplasty or stent placement is necessary, while reducing the need for invasive procedures. It is increasingly used in conjunction with modern imaging modalities like CT angiography or intravascular ultrasound for more precise, patient-specific cardiovascular care.

The major global suppliers of Image-based FFR Diagnosis include HeartFlow, Medis

QFR, Beijing Heart Century, Raysight, Keya Medical, ArteryFlow Technology, Pulse Medical Imaging, Fosun Aitrox, Beijing GuanShengYun, Shukun, ShengShi, etc. The global players competition landscape in this report is divided into three tiers.
