Research Summary

Imaging colorimeters and photometers are sophisticated optical instruments used for the precise measurement and analysis of light and color characteristics in various applications. These devices capture and evaluate luminance, chromaticity, and other optical parameters to assess the quality and performance of displays, lighting systems, and illuminated objects. Imaging colorimeters utilize imaging sensors and advanced algorithms to provide spatially resolved measurements, enabling detailed analysis of color and brightness variations across a visual display. Photometers, on the other hand, typically focus on luminance measurements and are commonly used for evaluating the brightness of light sources. Both imaging colorimeters and photometers find applications in industries such as display manufacturing, automotive design, aerospace, and lighting, contributing to the optimization of visual quality, color accuracy, and lighting conditions in a wide range of products and environments.
